Interface Description

(Capacitive Touch model shown above as reference)

Num.	Description
1)	(LED2) LED Indicator for Touch – Resistive Touch model only. This is a Red LED that will blink slowly (once per second) if the RTP controller is powered ON, awake, and no touch is detected. This LED will blink rapidly (5 times per second) if the RTP controller detects a touch.
2)	(LED4) LED Indicator for Touch – Capacitive Touch model only. This is a Red LED that will illuminate when there is a touch sensed on the CTP.
3)	(LED3) LED Indicator for Power. This is a Green LED that will illuminate when DC power is supplied to the module.
4)	(CN3) DC Jack (Center-Positive). This is used to supply power to the display module. A DC power supply in the range of 5-7.5V should be used. The output current rating of the DC power supply should be at least the maximum Supply Current (I_{DD}) listed in the Electrical Characteristics section on page 8.
5)	(CN4) Surface Mount Pin Header, 2.54mm pitch, for Backlight PWM. The pin labelled 'PWM' is connected directly to the LED driver's CTRL pin (T.I. TPS61165). This is a multifunctional pin which can be used for enable control, PWM, and digital dimming. The PWM signal's frequency and duty cycle should operate within the specified ranges listed in the Electrical Characteristics section on page 8.
6)	(CN2) Micro-USB (Type-B) Connector for Touch – Touch Panel models only. This is to connect the Touch Panel of this module to a USB input to act as a USB-HID device.
7)	(LED1) LED Indicator for Video. This is a Blue LED that will illuminate when there is an active video signal detected.
8)	(CN1) HDMI (Type-A) Connector for Video. This is a full-size HDMI connector meant to connect the HDMI source signal (Video only) to this module. The on-board T.I. TFP401A HDMI/DVI Receiver does not scale video resolutions. Therefore, the output resolution of the source must be 800x480 (WVGA).

Raspberry Pi Application

On the Raspberry Pi, we recommend forcing the HDMI resolution by using the following config.txt file (in /boot/config.txt) - you can edit it by inserting the Pi's SD card into your computer.

```
# uncomment if you get no picture on HDMI for a default "safe" mode
#hdmi_safe=1

# uncomment this if your display has a black border of unused pixels visible
# and your display can output without overscan
#disable_overscan=1

# uncomment the following to adjust overscan. Use positive numbers if console
# goes off screen, and negative if there is too much border
#overscan_left=16
#overscan_right=16
#overscan_top=16
#overscan_bottom=16

# uncomment to force a console size. By default it will be display's size minus
# overscan.
#framebuffer_width=1280
#framebuffer_height=720

# uncomment if hdmi display is not detected and composite is being output
hdmi_force_hotplug=1

# uncomment to force a specific HDMI mode
hdmi_group=2
hdmi_mode=1
hdmi_mode=87
hdmi_timings=800 0 40 48 44 480 0 13 3 30 0 0 0 60 0 32000000 6

# uncomment to force a HDMI mode rather than DVI. This can make audio work in
# DMT (computer monitor) modes
#hdmi_drive=2

# uncomment to increase signal to HDMI, if you have interference, blanking, or
# no display
#config_hdmi_boost=4

# uncomment for composite PAL
#sdtv_mode=2

#uncomment to overclock the arm. 700 MHz is the default.
#arm_freq=800
```
